## BENEFITS OF ICX-TUBER

- ➔ Avoid augmentation and sinus lift
- ➔ More security and predictability
- ➔ More satisfied patients
- ➔ More flexibility for prosthetics

## THE NEW V-ON-ICX CONCEPT FOR THE SPECIAL NEEDS OF DENTISTS

Inserting an ICX-TUBER implant is an alternative to avoiding a sinus lift or other transplant procedures for treating the back of the upper jaw and distal cantilevers without support, in cases of partial and complete tooth loss.

**ICX-TUBER implants offer dental professionals** a high degree of flexibility in terms of placement and prosthetic options.

Its unique design expands treatment options. High-temperature acid etching creates the special microroughness of the ICX implant surface.

The resulting topography provides an ideal structure for cell attachment.

**THE ICX-TUBER implant has an enlarged thread** in the upper area to compress the bone, the implant body is conical and in the apical area the thread is sharp-edged with decompression grooves to facilitate removal and repositioning.

This combination can shorten the healing time and enable optimised early and immediate loading.

The apically conical implant thread optimises insertion of the ICX-TUBER implant.
